26 November 2021

Integrated Eutrophication Status Assessment

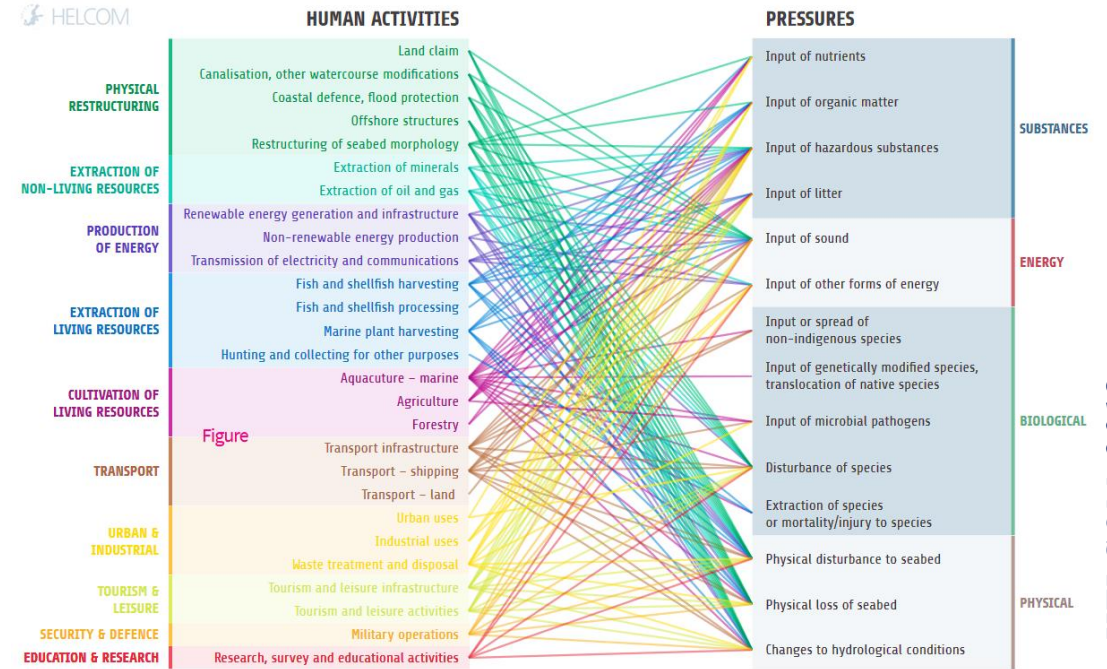

97% of the Baltic Sea region is assessed as eutrophied in 2011–2016, according to the integrated status assessment by HELCOM.

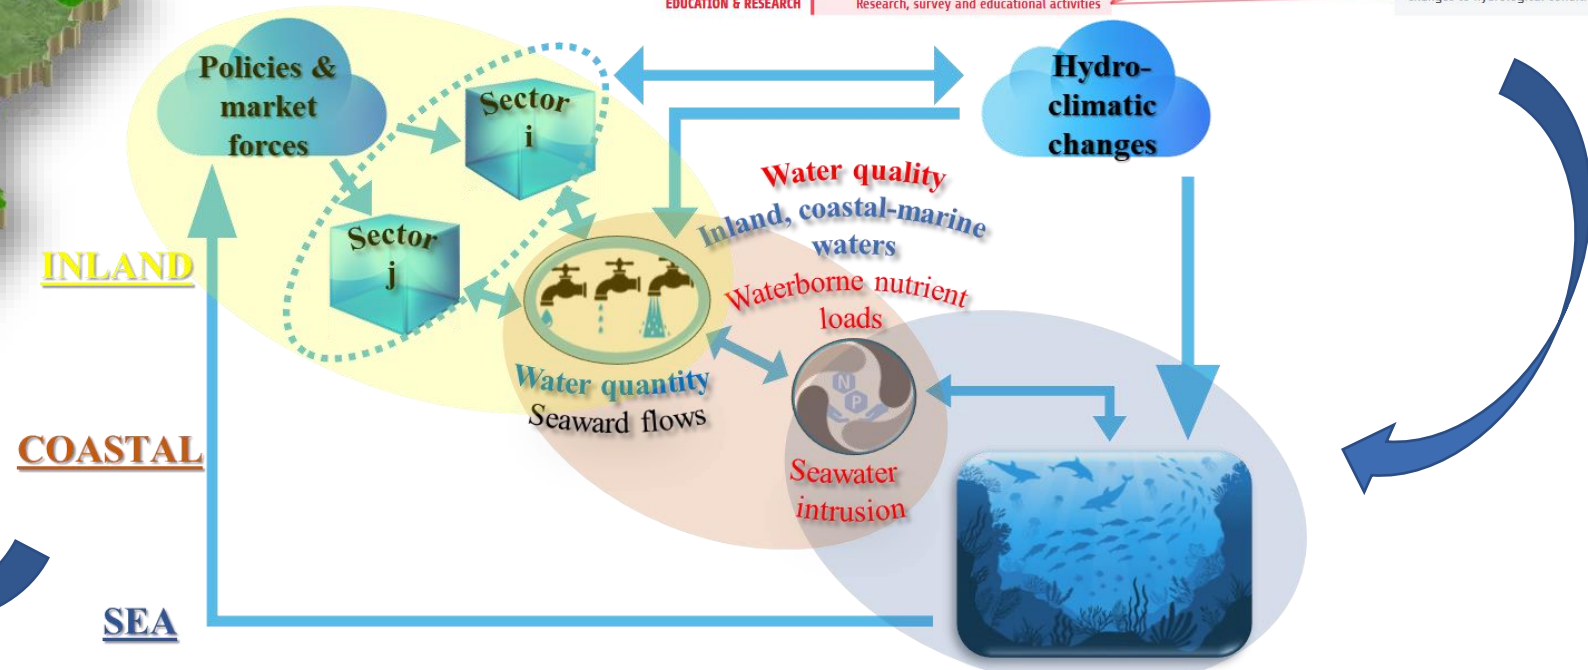

Evolution and source attribution of annual waterborne and total loads of nitrogen and phosphorus from land to the Baltic Sea during 1900-2014. Sources: HELCOM, 2010 and 2018

COASTAL

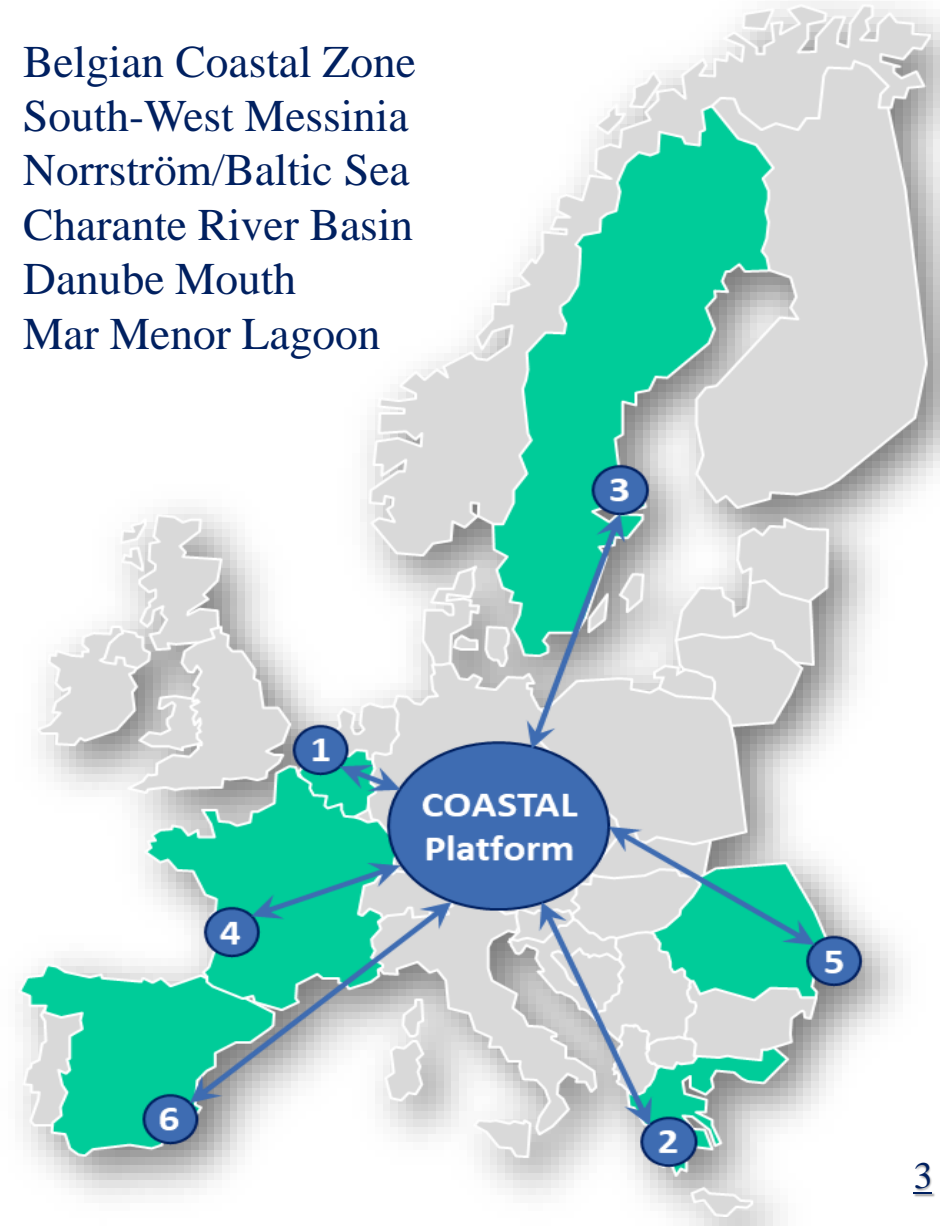

Collaborative Land-Sea
Integration Platform

2018 - 2022

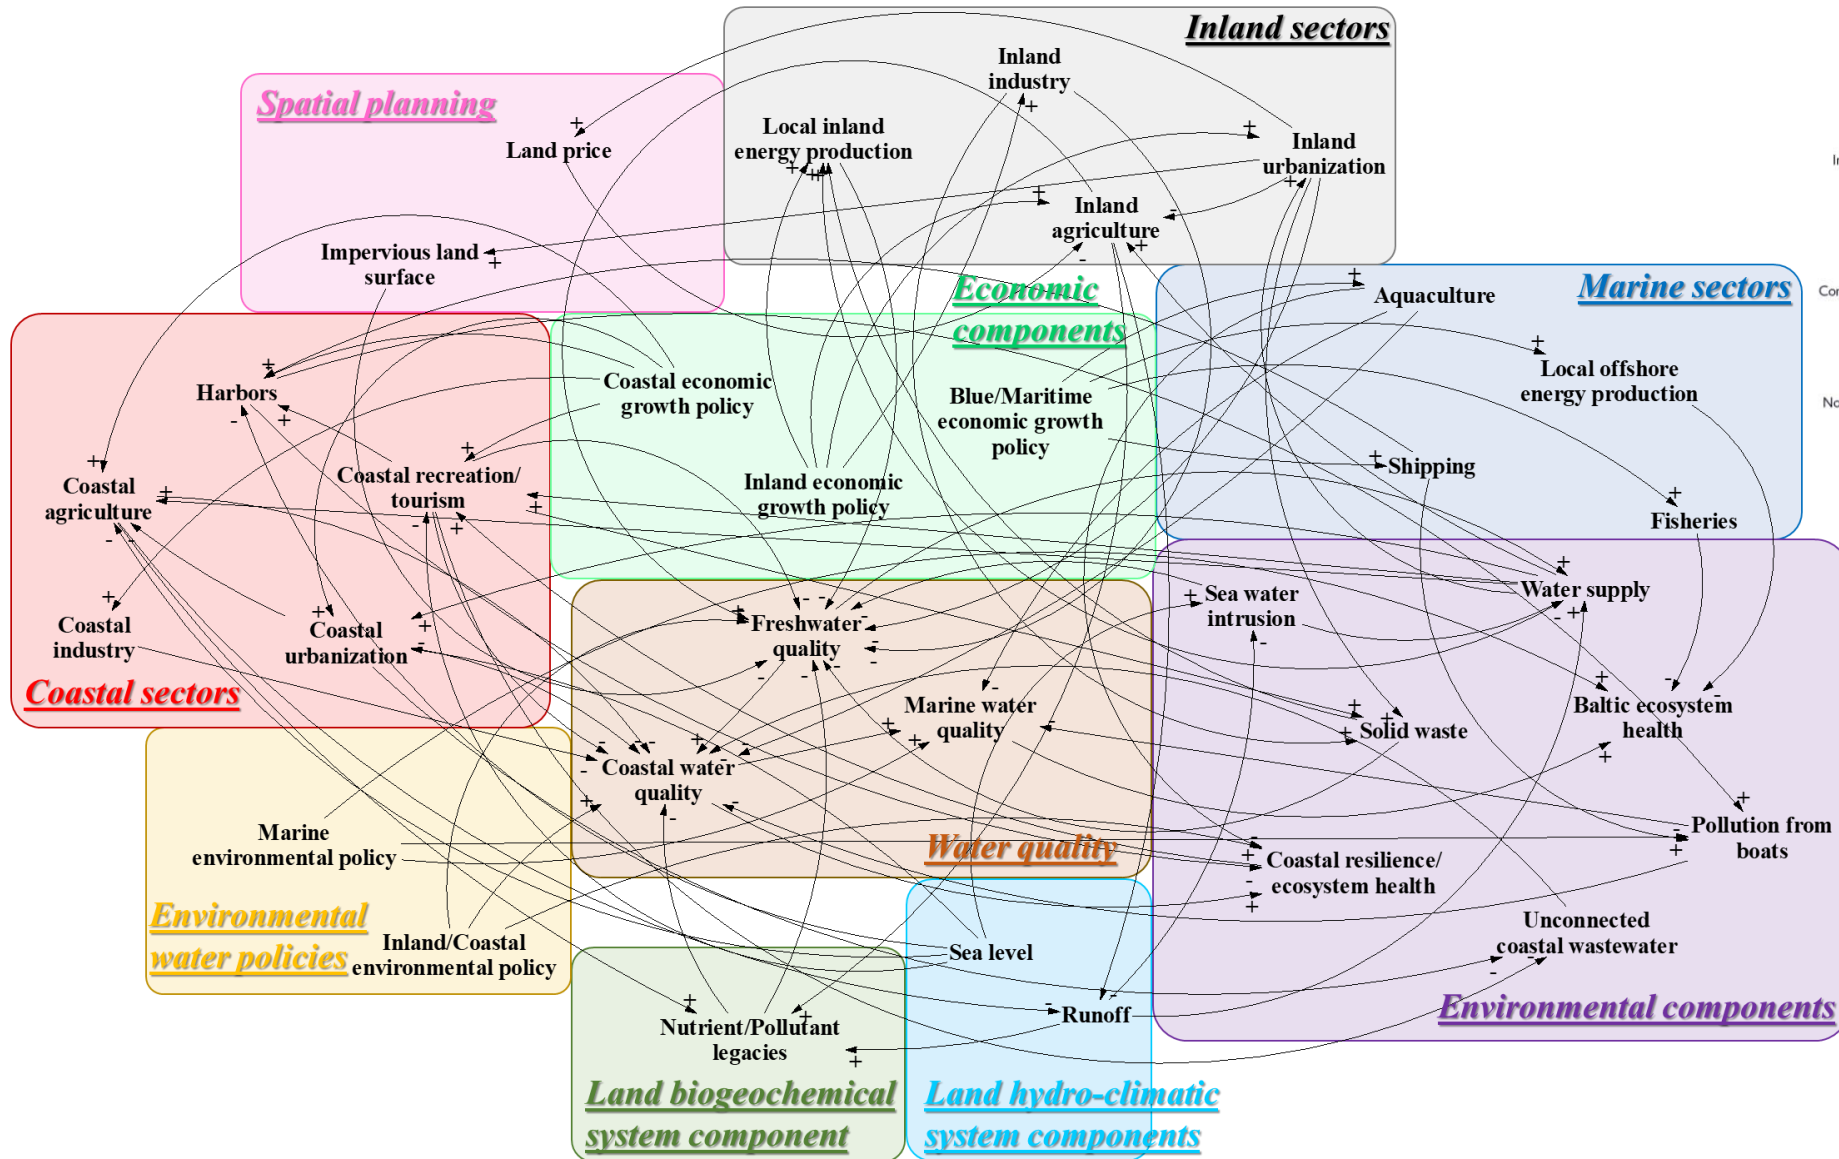

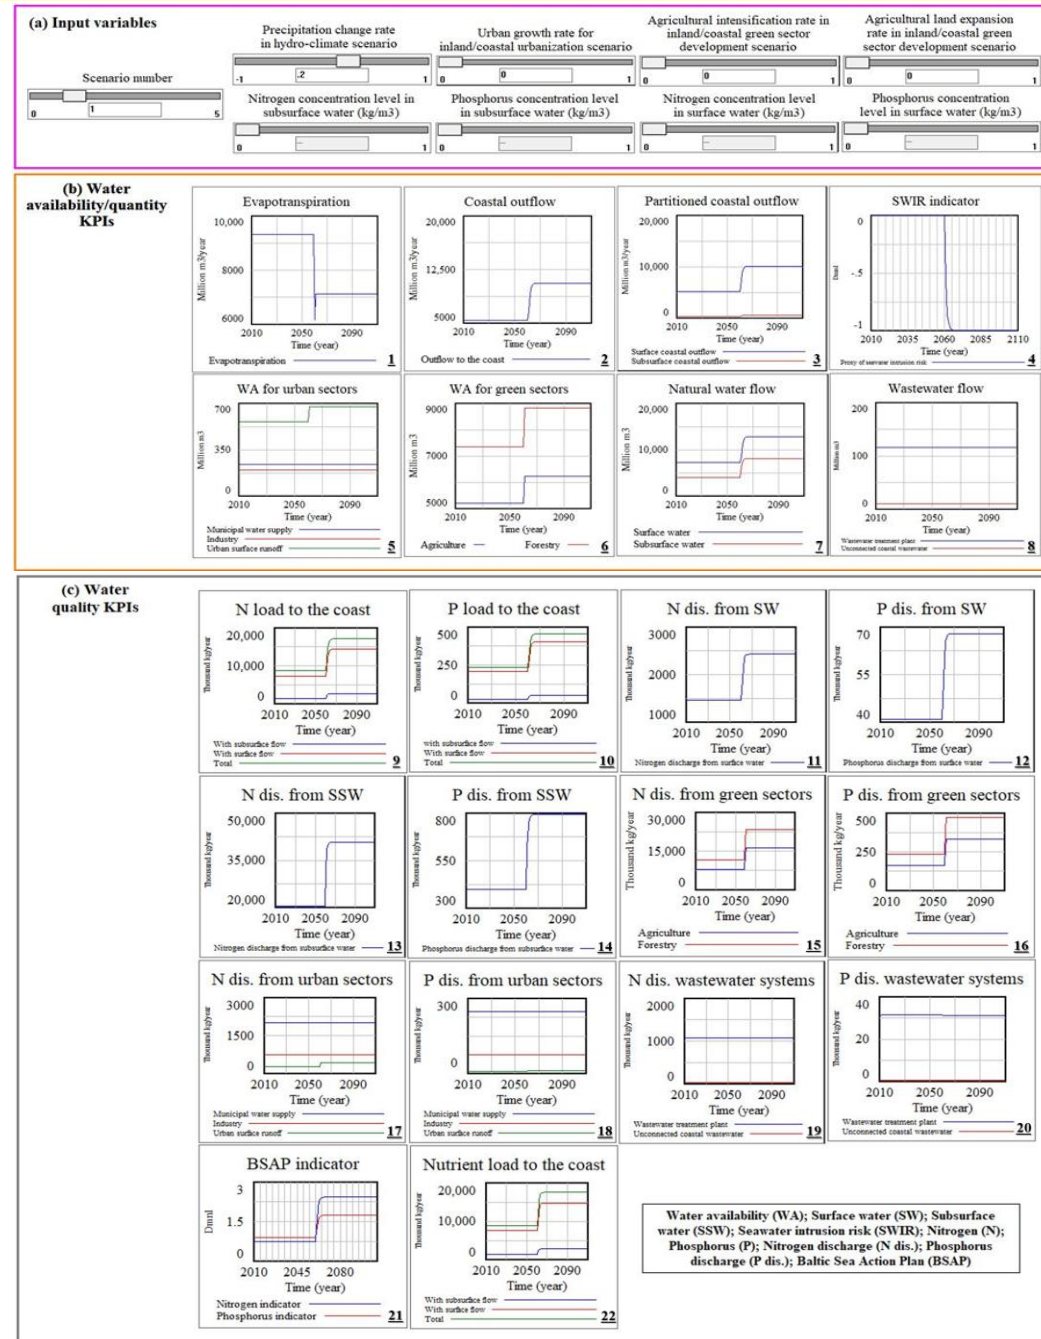

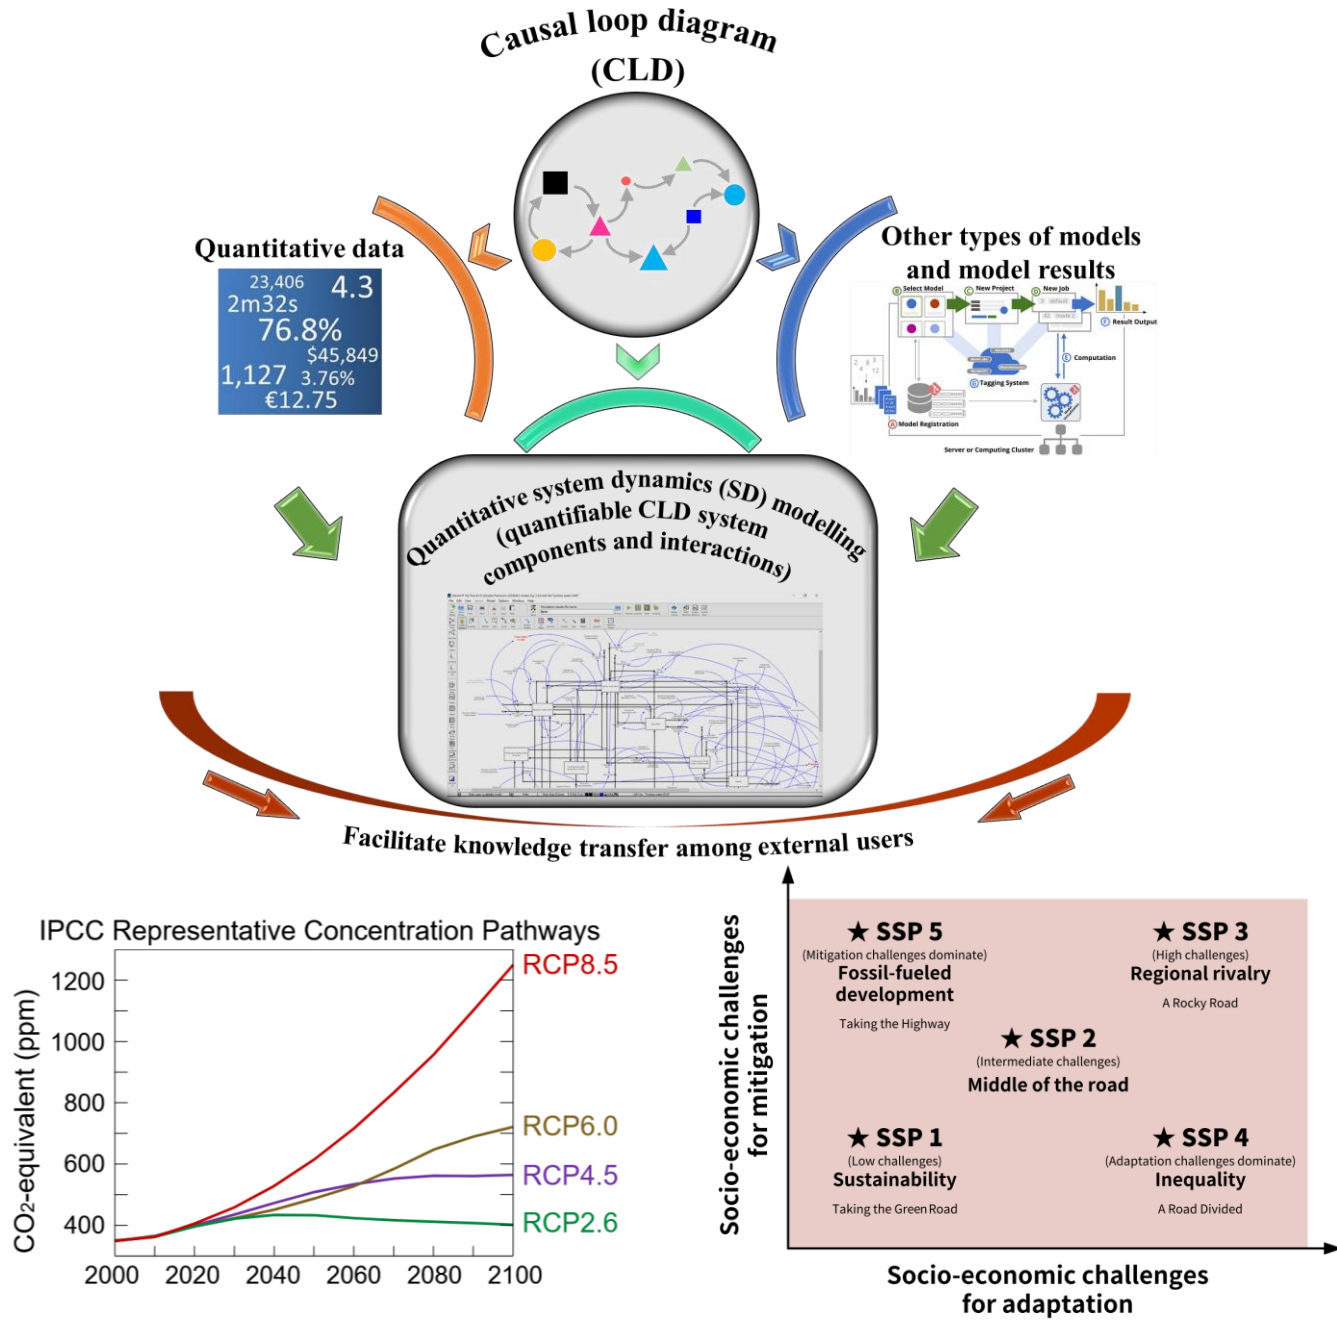

Multi-Actor Labs

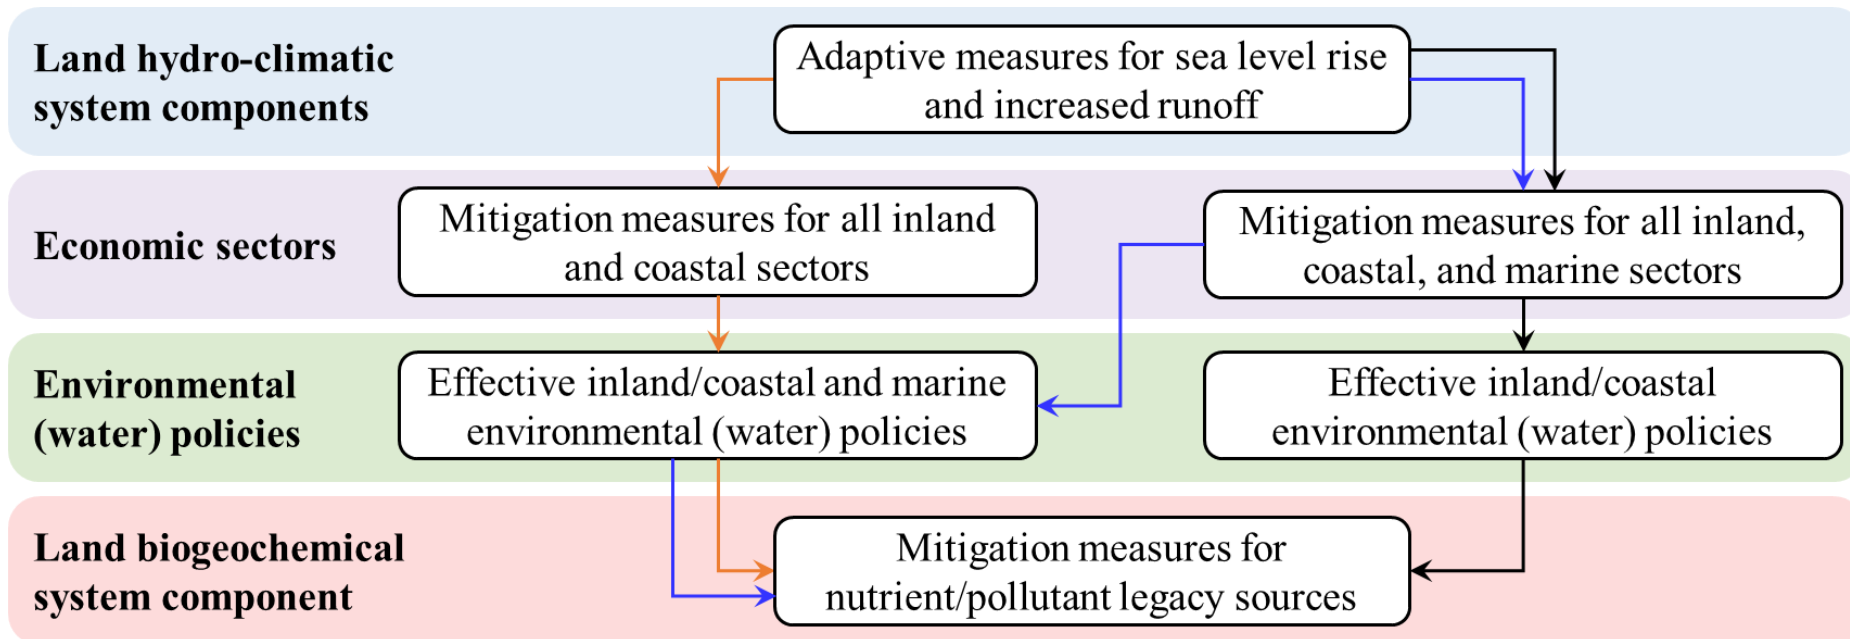

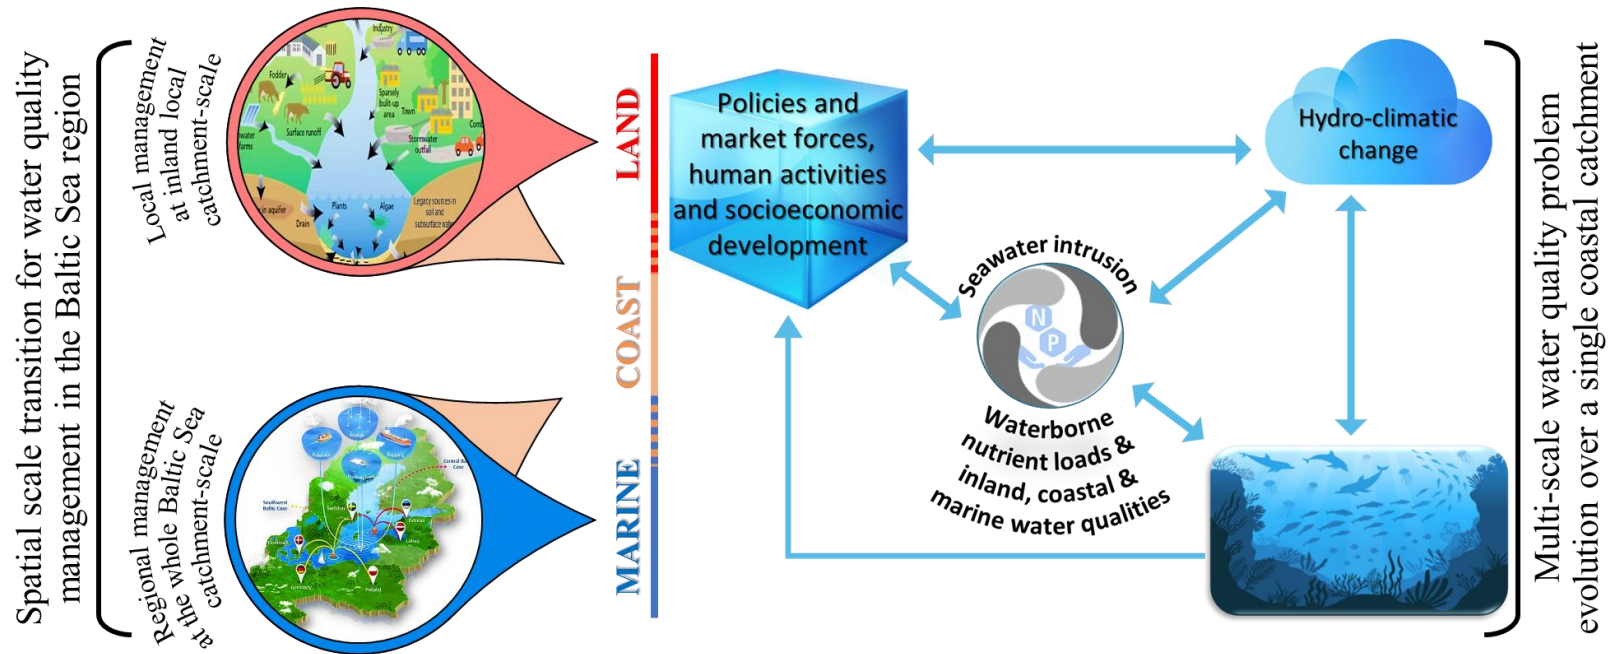

1. Belgian Coastal Zone
2. South-West Messinia
3. Norrström/Baltic Sea
4. Charante River Basin
5. Danube Mouth
6. Mar Menor Lagoon

Regional causal loop Diagram (CLD) and Fuzzy cognitive mapping (FCM)

Key messages

- Cross-scale and multi-sectoral **synergistic management measures** are required for considerable improvement of inland, coastal, and marine water quality in the Baltic Sea region.
- Synergistic management strategies should involve mitigation of the **potential dominant contribution from nutrient legacy sources** to the water bodies in the Baltic Sea region.
- Planned socioeconomic developments with projected hydro-climatic conditions will **reduce the seawater intrusion risk** in the Baltic coastal areas.
- Coastal nutrient (nitrogen and phosphorus) **load targets set in regional policies will not be achieved** with planned socioeconomic developments and projected hydro-climatic conditions.
